# **Secure Password Reset**

Web-Application

### 1. Overview

This application allows users to set a new password on their LDAP account when they lost their current password or if it expired. It uses the OpenOTP second login factor (SMS, Token or Yubikey) to authenticate the password reset operation. Alternatively, TiQR (QRCode login) and PKI access with user certificate can be used as authentication back-ends.

RCDevs Password Reset is compliant with any LDAP password including AD Domain passwords, UNIX passwords and even SAMBA accounts. You can define password complexity policies or let the application obey the existing AD password policy. The password complexity configuration includes password size, type of characters, password blacklist and even dynamic complexity requirements per password length.

The installation of PwReset is straightforward and only consists of running the self-installer or installing it from the RCDevs repository and configure the application in WebADM.

You do not have to modify any files in the PwReset install directory! The web applications configurations are managed and stored in LDAP by WebADM. To configure PwReset, just enter WebADM as super administrator and go to the <a href="Applications">Applications</a> menu. Click PwReset to enter the web-based configuration.

PwReset application logs are accessible in the **Databases** menu in WebADM.

Note

To be able to use PwReset, some Directory server like Active Directory have to communicate over SSL with WebADM.

Note

To be able to use PwReset, any LDAP user must be a WebADM account. That means usable LDAP accounts are those containing the webadmAccount LDAP object class. You can enable the WebADM features on any LDAP user/group by extending it with the webadmAccount object class (from object extension list).

Inline WebApps:

You can embed a Web app on your website in an HTML iFrame or Object.

#Example

<object data="https://<webadm addr>/webapps/pwreset?inline=1" />

# 2. PwReset Installation

The Secure Password Reset application is included in the Webam\_all\_in\_one package.

## 2.1 Installation with Redhat Repository

On a RedHat, CentOS or Fedora system, you can use our repository, which simplifies updates. Add the repository:

yum install https://repos.rcdevs.com/redhat/base/rcdevs\_release-1.1.1-1.noarch.rpm

Clean yum cache and install Secure Password Reset (PwReset):

yum clean all yum install pwreset

The Secure Password Reset application is now installed.

## 2.2 Installation with Debian Repository

On a Debian system, you can use our repository, which simplify updates. Add the repository:

wget https://repos.rcdevs.com/debian/base/rcdevs-release\_1.1.1-1\_all.deb apt-get install ./rcdevs-release\_1.1.1-1\_all.deb

Clean cache and install Secure Password Reset application (PwReset):

apt-get update apt-get install pwreset

The Secure Password Reset application is now installed.

### 2.3 Through the self-installer

Download the pwreset package from the RCDevs website, copy it on your WebADM server(s) and run the following commands:

[root@webadm1 tmp]# gunzip pwreset-1.0.12-1.sh.gz

[root@webadm1 tmp]# sh pwreset-1.0.12-1.sh

PWReset v1.0.12-1 Self Installer

Please read the INSTALL and README files in /opt/webadm/webapps/pwreset.

PwReset is now installed and can be configured under the WebADM Admin GUI.

# 3. PwReset configuration

To configure the PwReset application, you have to log in on the WebADM Admin GUI > Applications Tab > Self-Service > Secure Password Reset (PwReset) > CONFIGURE.

PwReset can be published through the WebADM Publishing Proxy for the end-user access with the setting

Publish on WAProxy. This setting is only available when WAProxy is configured with WebADM. Have a look at this

documentation to set up WAProxy. If you publish PwReset on WAProxy, take into account the setting Password Reset URL.

This URL should be edited to point to WAProxy if you sent automatic PwReset link when users password is expired. The default URL for this setting is: <a href="https://webADM\_Server\_IP/webapps/pwreset/">https://webADM\_Server\_IP/webapps/pwreset/</a>. If you publish the PwReset application through WAProxy then the URL must be changed to this:

https://WAProxy\_Server\_IP/pwreset/

The /webapps/ folder disappear from the URL when you use WAProxy.

A feature dedicated to Active Directory is Allow Account Unlock which allows the user to unlock his account by himself at the AD level. The proxy\_user must have the right permissions to allow this action. Please refer to this documentation for more information about proxy\_user rights on Active Directory.

The other settings are described under the Secure Password Reset configuration page.

	Web Application Settings							
	Disable WebApp	Yes No (default)						
	Hide WebApp	Yes No (default)						
	Hide application from WebApps portal.							
✓	Publish on WAProxy	Yes     No (default)						
	Make WebApp accessible from WAProxy reverse-proxies.							
✓	Default Domain	Default <b>▼</b>						
	This domain is automatically selected when no domain is provided.							
	Enable Group Settings	Yes (default)     No						
	Resolve application settings on user groups (direct and indirect). Warning: Impacts performances.							
	Require Access Unlock	Yes No (default)						
	Login is not permitted unless the user is temporarily authorized.  To authorize a user, use the 'Unlock WebApp access' action for the user.  IMPORTANT: Self-service applications published on the Internet without MFA should be locked.							
	Non-locked IP Addresses							
	Comma-separated list of IP addresses with netmasks for which access is never locked (ex: 192.168.1.0/24).							
	Allowed IP Addresses							
	Comma-separated list of IP addresses with netmasks (ex: 192.168.1.0/24). If not set then any source IP is allowed. The localhost is always allowed.							
	Custom CSS File	Edit						
	CSS files and additional custom resources must be stored under /opt/webadm/lib/htdocs/custom/.							
	Default Language	EN T

# 3.1 Weak and Pwned password

The OpenOTP server and PwReset app include a feature to detect weak or compromised passwords starting from WebADM v2.3.10 / OpenOTP v2.2.11 / PwReset v1.3.2

Weak or compromised passwords refer to passwords that are either easily guessable, simple, or have been exposed through security breaches. WebADM includes the option to detect a weak password and automatically send the user an alert along with a link to reset their password:

### OpenOTP:

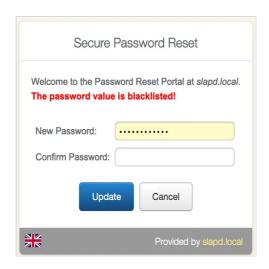

#### **PwReset:**

If you choose Pwned option, the user must select a strong password that is not known to be compromised on <a href="https://haveibeenpwned.com">https://haveibeenpwned.com</a>

Here, I tried to set the password as: Password123

# 4. Proxy\_user rights on AD for PwReset

The proxy\_user will operate for the user to reset the password. That means that the proxy\_user account must have the rights at the AD level to reset users password and to unlock the account if you want to enable this option.

#### 4.1 Domain User accounts

For domain users, you have to configure the following rights for the proxy\_user:

#### Password reset rights:

dsacls "CN=Users,DC=test,DC=local" /I:T /G 'TEST\proxy\_user:WPRP;userPassword' dsacls "CN=Users,DC=test,DC=local" /I:T /G 'TEST\proxy\_user:WPRP;pwdlastset'

#### **Unlock account rights:**

dsacIs "CN=Users,DC=test,DC=local" /I:T /G 'TEST\proxy\_user:WPRP;lockouttime'

#### 4.2 Domain Administrator accounts

For domain admin users, you have to configure the rights on the AdminSDHolder object else, rights will be overridden after an hour.

#### Password reset rights:

dsacIs "CN=AdminSDHolder,CN=System,DC=test,DC=local" /G 'TEST\proxy\_user:WPRP;userPassword' dsacIs "CN=AdminSDHolder,CN=System,DC=test,DC=local" /G 'TEST\proxy\_user:WPRP;pwdlastset'

#### **Unlock account rights:**

dsacIs "CN=AdminSDHolder,CN=System,DC=test,DC=local" /G 'TEST\proxy user:WPRP;lockouttime'
