WebADM Upgrade Guide from v1.5

[upgrade](#)

1. Introduction

This document provides the necessary information for upgrading servers running WebADM v1.5.x to WebADM v1.7.x. WebADM v1.7 is a major upgrade of RCDevs WebADM.

The reader should notice that this document is not a guide for installing WebADM or its applications (Web Services and WebApps). Specific application guides are available through the [RCDevs Online Documentation](#). WebADM usage manual is not covered by this guide and is documented in the RCDevs WebADM Administrator Guide available through the RCDevs' online documentation website. In this guide, we will consider a common installation scenario where WebADM is running in cluster mode with two active servers.

2. Backup Your Server

Before upgrading, please back up your WebADM configurations on any WebADM server. Therefore, please follow this guide [Backup & Restore](#), that covers backup and restore recommendations for a typical RCDevs solution deployment including WebADM, OpenOTP with Radius Bridge and RCDevs Directory Server.

3. Install the Upgrade Package

You will need to perform the following instructions on all the servers of your cluster.

3.1 Upgrade WebADM through RCDevs Repository

To upgrade RCDevs packages with the RCDevs repository, packages should be installed first through the repository. To install RCDevs repository and install packages through the repo, please follow the [RCDevs Repository documentation](#).

To upgrade packages through the repository:

3.1.1 RHEL/CentOS

```
[root@localhost tmp]# yum update
```

3.1.2 Debian/Ubuntu

```
[root@localhost tmp]# apt-get update
```

3.2 Upgrade WebADM through the Shell Script

› Download the WebADM v1.7.x all-in-one package.

- › Copy the package on the servers with WinSCP or another SCP tool.
- › Connect the servers via SSH or Putty.
- › Uncompress the package with:

```
gunzip webadm_all_in_one-1.7.x.x64.sh.gz
```

Note

Please uncompress the GZ archive once copied on the Linux server and not under Windows!

- › Run the upgrade tool with the commands:

```
[root@centos7 tmp]# bash webadm_all_in_one-1.7.0-x64.sh
```

```

Checking PKI service access... Ok

[root@centos7 tmp]#

Your WebADM server is now up-to-date.

4. Adjust Application Configurations

WebADM 1.7.x comes with upgrades for all your registered applications. Some of them may be missing some mandatory settings after the upgrade. In this case, go to the Applications menu and click the **CONFIGURE** button for any application where the **Not Configured** message in red is displayed, scroll down until the end of the configuration page and click **Apply** button.

The screenshot shows the WebADM Freeware Edition v1.7.0 interface. On the left, there is a sidebar with a tree view containing 'LDAP Server (OpenLDAP)', 'OpenLDAP (2)', 'dc=WebADM', 'o=Root (2)', 'cn=admin', and 'cn=ppolicy'. The main content area is titled 'Registered Applications and Services'. Under the 'Web Services' section, the 'MFA Authentication Server 1.3.2-2 (Commercial)' is listed. Its status is 'Not Configured' in red. Below the status, there are links for '[CHECK]', '[CONFIGURE]', and '[REMOVE]'. The service URL (STD) is 'http://192.168.3.80:8080/openotp/' and the service URL (SSL) is 'https://192.168.3.80:8443/openotp/'. The SOAP WSDL file is 'openotp.wsdl'.

The Web Service status should be now **Enabled** in green.

The screenshot shows the WebADM Freeware Edition v1.7.0 interface after configuration. The 'MFA Authentication Server (OpenOTP) v1.4.3 (Commercial)' is now listed with a status of 'Enabled' in green. The links for '[CONFIGURE]' and '[REMOVE]' are still present. The service URL (SSL) is 'https://192.168.3.174:8443/openotp/' and the service URL (STD) is 'http://192.168.3.174:8080/openotp/'. The mobile endpoint is 'https://192.168.3.174/ws/openotp/' and the U2F facet endpoint is 'https://192.168.3.174/ws/appid/'. The SOAP WSDL file is 'openotp.wsdl'. Below this, the 'SSH Public Key Server (SpanKey) v2.0.3 (Commercial)' is also listed with a status of 'Enabled' in green. Its service URL (SSL) is 'https://192.168.3.174:8443/spankey/' and its service URL (STD) is 'http://192.168.3.174:8080/spankey/'. The SOAP WSDL file is 'spankey.wsdl'.

Your server is now ready to work with the updated version.
